## Robotic Process Automation In Number Portability

# Mobile Number Portability

MNP is a facility which allows subscribers to retain their number even after switching operator, services or location.

MNP implementation started in late 1990s from mature European markets like Netherlands and UK. The objective was to facilitate competition amongst operators on other networks. Now it has been embraced by more than 70 countries.

## Time taken to import number varies widely across countries

to more than a month in few other countries

## Costs involved

**Setup Cost** – Cost of setting up NPDB (NP database), NP gateway server, Software development, Network upgrade, CRM upgrade etc.

**Maintenance Cost** – cost for the agreed procedure, activating the ported number, provisioning routing information

**Call routing cost** – Irrespective of number is ported or not, NPDB needs to be queried every time impacting network signaling and resources. This affects the network traffic and adds to the cost.

Empowers customer to be lifelong owner of his mobile number while switching to best service provider. This saves them from additional hassle of updating contact books, informing friends, families etc.

Increases competition among operators for customer retention fostering better service quality, increased gamut of services, improved prices etc.

In some countries, where directory number resources (i.e. number ranges) were exhausted, the infrastructure to facilitate MNP allowed number planning administrators to assign number more efficiently

# POTS Line Number Portability

**Plain Old Telephone System is a voice-grade telephone service using analog signal transmission over copper loops.**

Started in **1876**, this was the only service provided by CSPs till the introduction of **Integrated Service Digital Network (ISDN)** in 1980s. POTS still remains the basic form of residential and small business communication in major part of the world. It is called as Location Number Portability.

The NPA-XXX of a number used to identify the State and rate center of original operator, the Service provider and the carrier type

NPA-NXX is the address of the switch serving the Telephone number. When a number is posted, a 10-digit LRN number is associated with it

Calls are now routed on the basis of NPA-NXX of the LRN number

## POTS line Number Portability

- It is also called as Local Number Portability
- It allows the user to switch their fixed line service provider while keeping the original telephone number
- LNP relies heavily on Location Routing Number (LRN) which is a unique 10 digit number assigned to each switch.

### Decoding NPA-NXX

NPA – Number  
Plan Area  
(Area Code)

N can be any  
number  
between 2 to 9

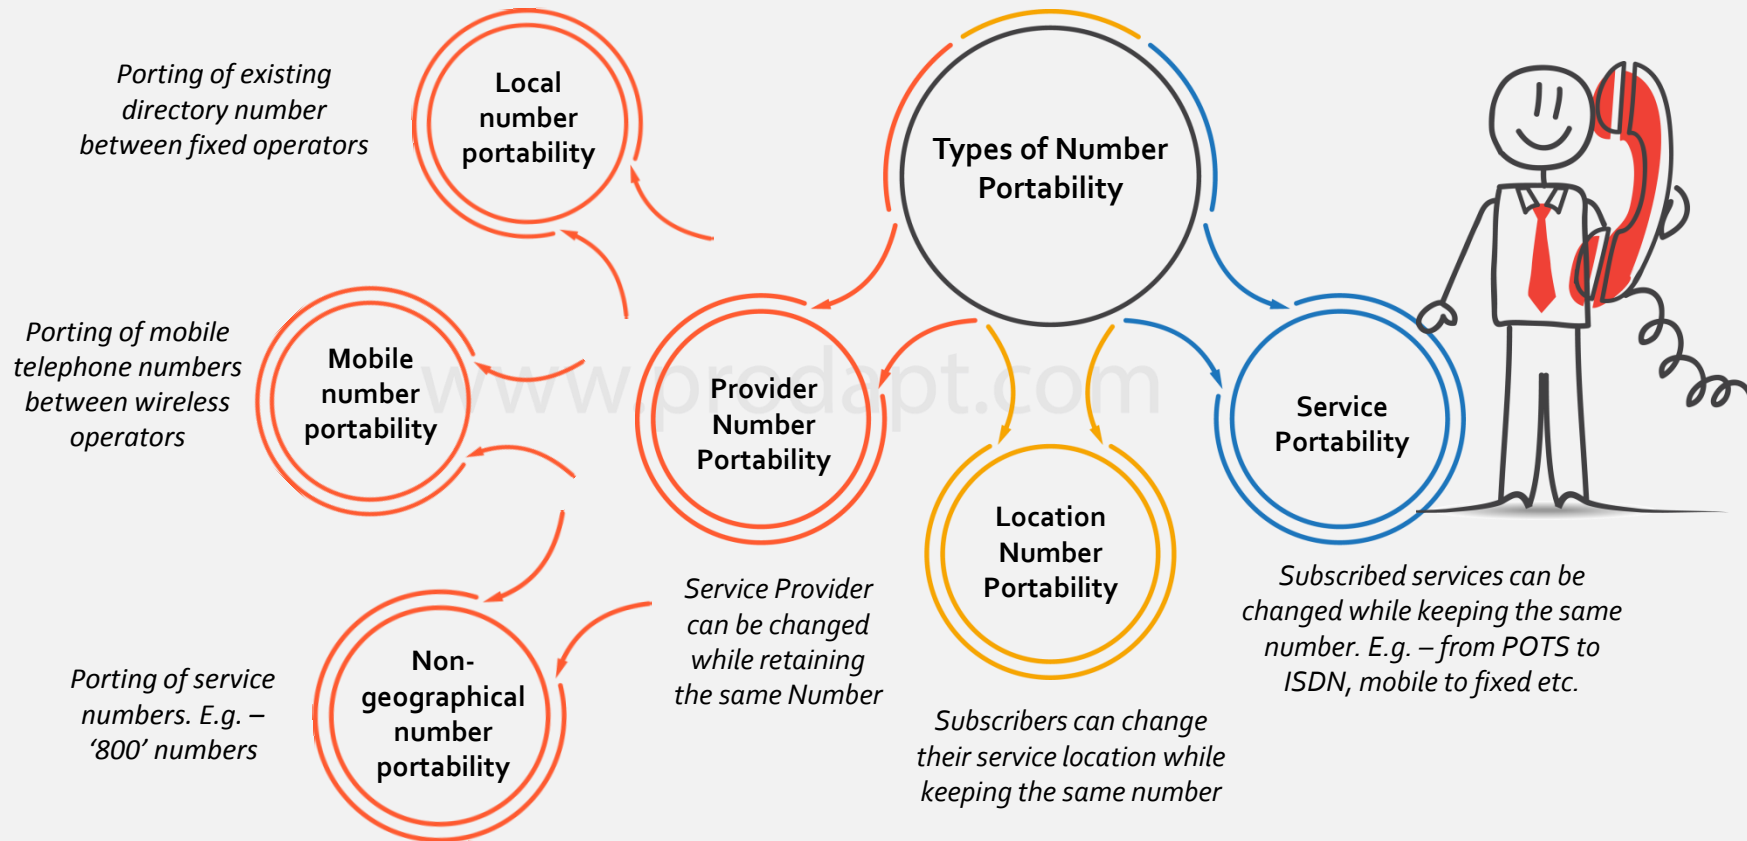

NXX – Prefix  
(Central  
Office Code)

P,A can be any  
number  
between 0 to 9

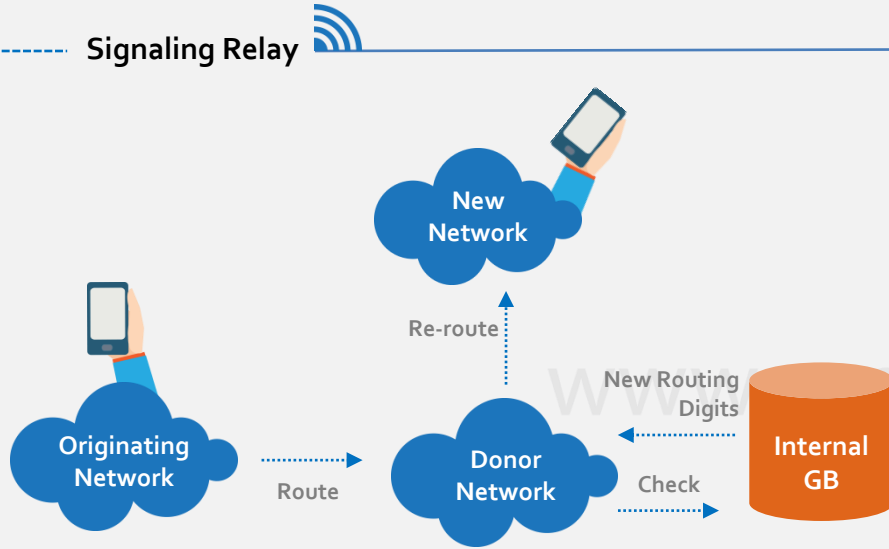

XXXX –  
Line  
Number

X can be any  
number between  
0 to 9

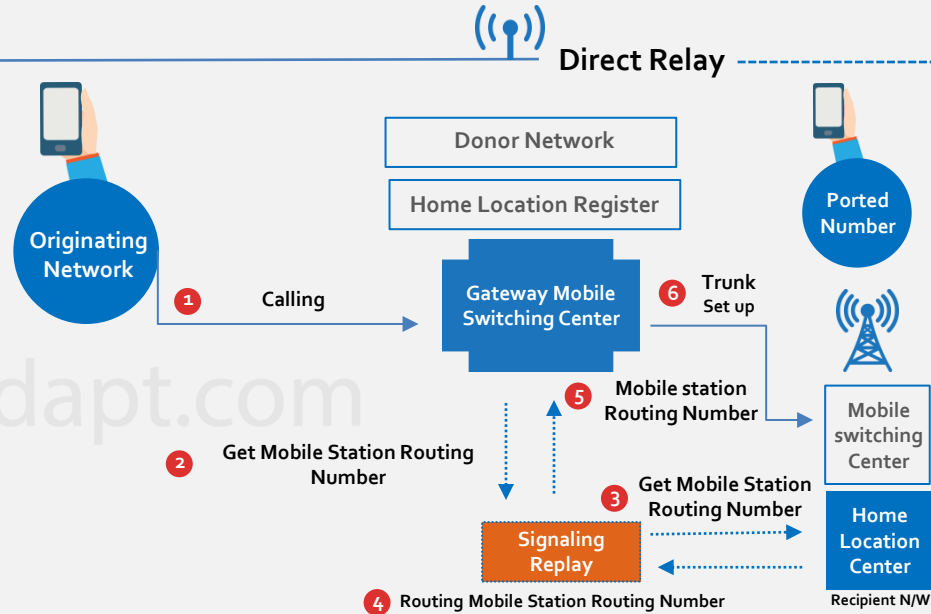

# Types Of Number Portability

# Mechanisms of Number Portability

- When the Call is dialed to ported number, it goes to the donor network, which transfers it to the recipient network
- Does not require centralized database
- Efficient when the quantity of ported numbers and operators are low

- Originating network contacts Gateway Mobile Switching Centre(GMSC). GMSC contacts HLR and upon detecting that the number is ported out, takes Mobile Station Routing Number from it. With the help of this MSRN, it establishes trunk call to recipient's GMSC
- Not an efficient approach as originating, donor as well as recipient network are busy to establish call

# Mechanisms of Number Portability

## All Call Query

A direct routing scheme which makes use of Centralized Number Portability Database

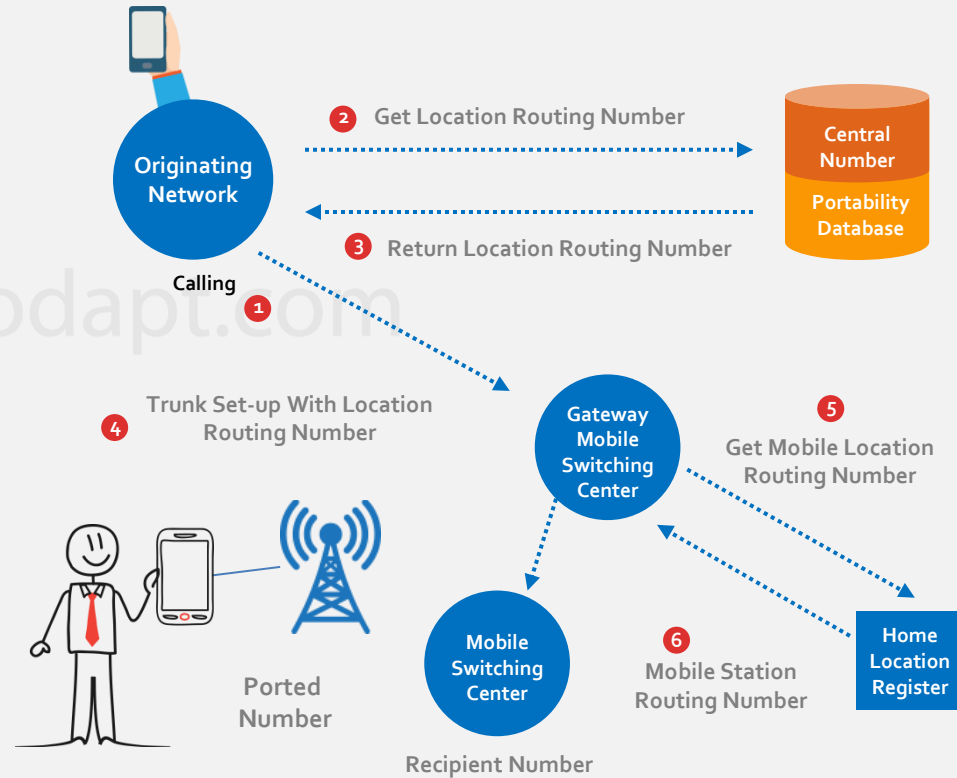

This is considered the most efficient method for large interconnected networks, with many operators and large quantity of ported numbers

The originating network directly queries the central ported database to determine the routing number required to call the recipient operator

After getting the number the call is directly routed to the recipient network

In the recipient network, call is directly forwarded to GMSC of recipient network, which trunks it to Mobile switching Center

The donor network is not involved in the process which makes it most resource efficient approach

# Challenges in implementing MNP, Solutions through RPA and Benefits

## Benefits

reduction in errors caused by manual intervention

of workforce can be reduced and moved to other intelligence heavy jobs

reduction in the time needed to complete the process

first touch resolution i.e. no. of events successfully completed in first attempt and sent to next step

## Challenges in MNP

Order download from multiple customer portals Manual intervention required:

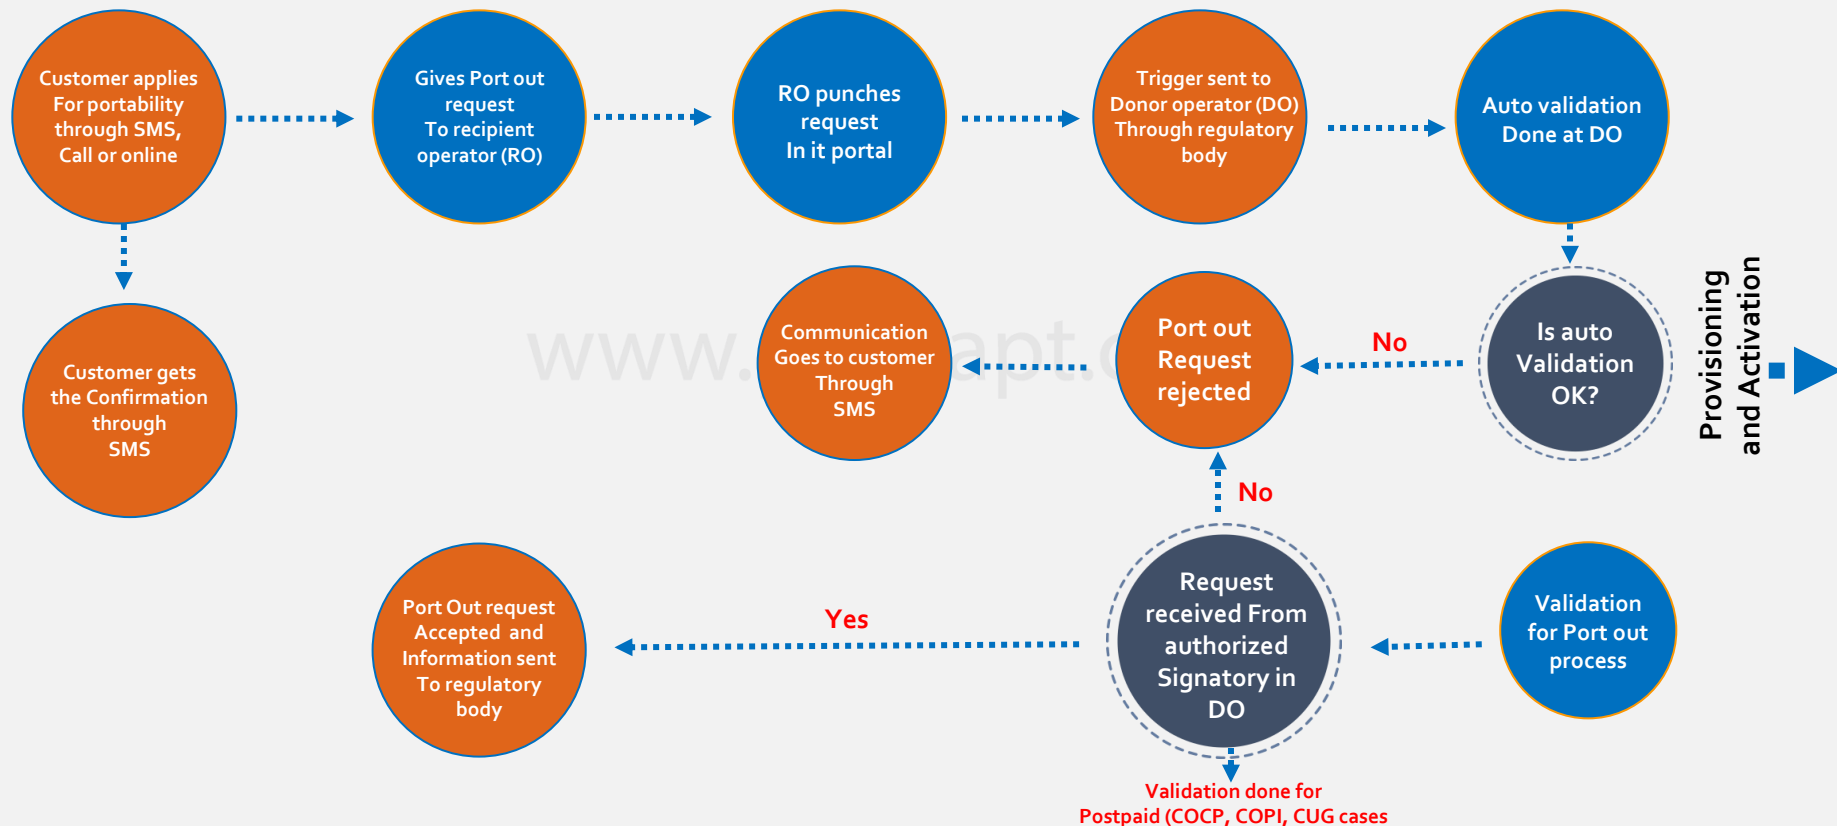

- Account number & Account telephone number validation
- Search & verify portable area
- Order creation in legacy application

## Solutions

- Order fetching from multiple portals
- Search and data aggregation from various web & Citrix based application
- Automated order entry in legacy application

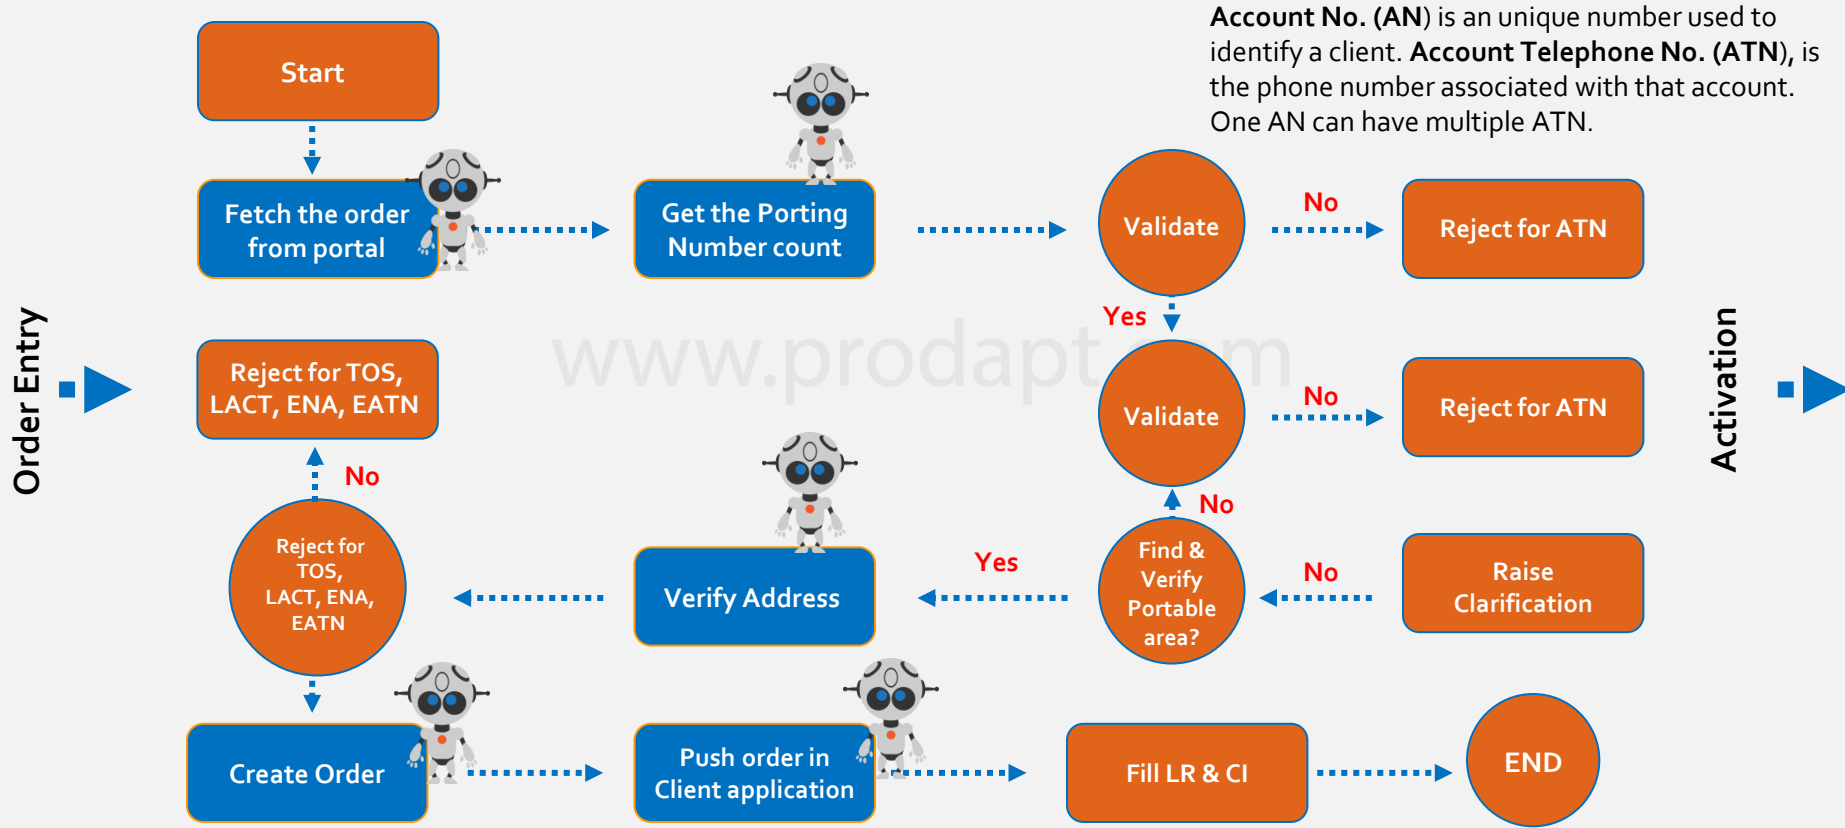

# Implementing RPA in Mobile Number Portability

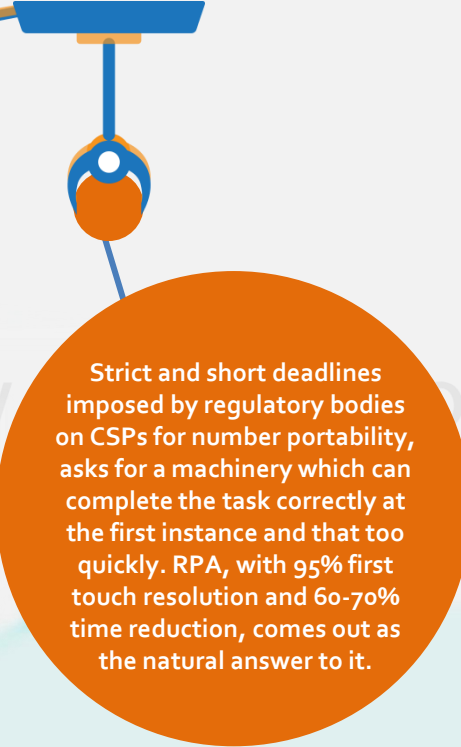

# Implementing RPA in POTS line Number Portability

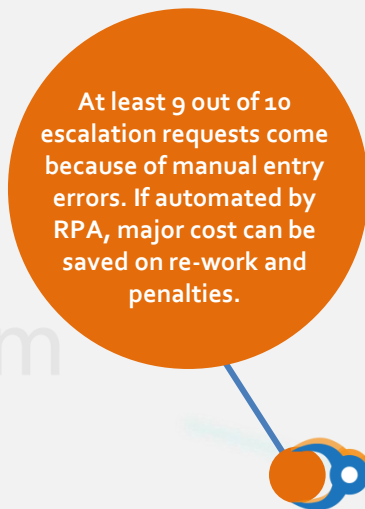

# Key Takeaways

MNP has increased competition in the telecom market. This is benefitting consumers with better rates, increased range of services and improved services quality.

Strict and short deadlines imposed by regulatory bodies on CSPs for number portability, asks for a machinery which can complete the task correctly at the first instance and that too quickly. RPA, with 95% first touch resolution and 60-70% time reduction, comes out as the natural answer to it.

At least 9 out of 10 escalation requests come because of manual entry errors. If automated by RPA, major cost can be saved on re-work and penalties.

THANKYOU!
